

ABSTRACT OF THE DISCLOSURE

An information terminal device 10 is connected to a server 1 storing instruction data 200. For the received instruction data 200, a determining unit 104 determines the corresponding application. An analyzing unit 105 analyzes the instruction data 200. An operation control unit 106 extracts message data from the instruction data 200. An application executing unit 107 operates based on the instruction data and the above application. A display unit 19 displays a message represented by the message data on a screen based on the execution of the application. With an execution checking unit further provided, it is possible to determine whether the application is to be executed based on the message data.
